

Palgey Maim The leading expert in water reclamation

Line of Business
WSS, WWTP,
Aqua Culture

Established
1973

Leading Executives
Mr. Zafir Sofer
CEO

Ms. Meytal Shen Zur
Marketing

Palgey Maim Ltd. was founded in 1973 and since then the company has been involved in flowing infrastructures covering a wide range of their various aspects: Reclaiming effluents for irrigation, supplying fresh water, removal and treatment of wastewater, urban and agricultural drainage, storing runoff water and waste water in reservoirs.

In all these fields Palgey Maim manages the initiation of system construction as well as the operation and maintenance of water and sewage systems including wastewater treatment plants, engineering planning, on-site supervision, drainage systems, project management, operations and maintenance.

investigating alternatives for wastewater treatment the company has worked to obtain all the statutory permits, brought together all the wastewater suppliers and the potential consumers for the effluents. The company has also constructed piping systems and pumping stations to collect the wastewater, as well as wastewater treatment plants, a system for discharging the effluents, storage facilities and furthered the supply of effluents in the best quality.

Fish Breeding Farms

The Company has gained considerable experience in the planning and construction of fish-

WWTP's

Palgey Maim Ltd. specializes in the planning and operation of wastewater treatment plants using many different technologies, and exploiting the knowledge which has been obtained years of experience. Among the different technologies employed are activated sludge, MBR, MBBR, wet land, SBR, and extensive plants.

Water Reuse

The shortage of fresh drinking water and the need to find creative solutions to the treatment of municipal and agricultural wastewater led to the emergence of unique solutions integrating different technologies. There is also a need to improve wastewater quality and reclaim them for irrigation in separate systems while maintaining the required quality.

Palgey Maim's holistic approach to this problem led to the initiation of practicable research for

breeding ponds using both extensive and intensive technologies, including reservoirs, storage ponds, fish harvesting methods, feeding systems and similar features.

Environmental Quality Elements in Dairy Farming

Palgey Maim has great experience in design systems for the collection and separation of cow manure, treatment of wastewater from milking parlors, walkways, manure drying systems and additional elements. The planning also includes compost sites and attention for all environmental aspects. Bringing together the knowledge and vast experience of our engineering and operation team in order to ensure the right solution to suit your needs. We invite you to be part of our success.
