Designed with your safety in mind, Guardians' series of Armour-G laminated security glass is a powerhouse of protection.

Guardians' market leading Armour-G™ glass is custom fabricated to withstand intentional impact, assault, blasts and attempts at forced entry, and is specially designed and tested to resist gunfire. Quite simply, Armour-G™ does not cave when faced by malicious threats, keeping what matters most to you safe.

The different Armour-G™ security glass products are at the front line against firing and detonations in areas where these pose a concern. They display unique properties which make the glass ideal for use in federal buildings, airports, military vehicles, banks, hospitals and other applications which require the best security solutions.

Bullet Resistant Glass

Bullet Resistant Glass has become a necessity of the 21st century. Such protection is used not only in the military sector but is also required for the security of civilian sites, including residential units and institutions. It is also used for transparent barriers, glass facades for buildings, glass shields for the protection of cashiers and security personnel etc.

Forced Entry Resistant Glass

Forced Entry Resistant Glass is in high demand for a variety of market sectors, from shop display counters and windows to residential and institutional windows and doors, offering a wide range of protective solutions against any number of threats such as theft and vandalism.

The Comprehensive Security Solution

We offer our customers a variety of solutions that are as comprehensive as they are effective. Once the required threat level is determined, we provide a product that fully meets all the requirements. Additional protective features may be added such as ballistic resistance.

Architectural Solutions

Armour-G™ Forced-Entry resistant glass meets all architectural requirements and specifications including special architectural glass.

Blast Resistant

Blast Resistant Glass offers a range of benefits for the protection of civilian populations in protected spaces, and the protection of sensitive installations in both the civilian and military sectors.

Such installations include refineries and chemical industries where there is a danger of explosive fumes, government and public buildings that are potential targets for terrorist attacks, communities that are built in airport areas and experience sonic booms etc.
