I.T.P. Novex is a leading provider of C4I and Location Systems, used by Law Enforcement, Intelligence Organizations and Army Forces all around the globe. The company offers two main lines of systems:

Management of Covert-Tracking Missions after Target Vehicles

The CarTraC Tracking System is a revolutionary latent surveillance system that facilitates location tracking and audio monitoring within moving target vehicles. It enables surveillance experts to simultaneously monitor conversations taking place within a moving vehicle and track the location of vehicles over digital color maps, in real-time.

The system contains the following types of probes units:

- Small autonomous, weatherproof units that are attached by magnets to the outside of the tracked vehicle; allowing location tracking.
- Miniature units with two attached microphones, designed to be mounted inside vehicles; allowing simultaneous voice and location monitoring.

The system functions in all countries where GSM cellular networks operate.

Management of Special Field Operations

The System has been designed to enable Commanders of Field-Operations to efficiently and effectively manage complex field operations by monitoring the exact location and movements of their different forces on the field.

The system contains compact and ruggedized location devices that are carried by the Special Forces. The location devices are equipped with an alarm button and a sensitive microphone in order to enable audio monitoring in the vicinity of the field soldiers.

The operation is monitored and controlled through dedicated Command Stations mounted on personal computers and Smartphones. The system enables several Command Stations to operate from different locations while monitoring the operation simultaneously.
