Timeneto's web-based biometric identification services system enables users to validate identification via smartphones, tablets, PCs and laptops, and create a secured access, protected from cyber security risks, to personal data and third party applications.

The system can be easily integrated with third party web-applications in various fields:

- Online age verification for online Gambling/ Gaming
- PayPal Transactions
- Web Election systems
- Offline device identification (increased security during cache mode)

Other web applications that require reliable multi-user accurate identification providing the highest level of security while maintaining high customer satisfaction

Timeneto technology (US granted patent) is based on a strong IP, creating a great technology and business advantage for any ISP, Mobile's OEMs and cloud service providers, as well as a great benefit for the end user.

The Technology

Timeneto's system is installed as a Central Identification Authority on Timeneto servers, providing identification services for third party customers. The system can be installed at the OEM side.

Timeneto's identification system can be accessed from devices such as smartphones, tablets and PCs, preventing fraud and transaction denial/cancellation, increasing device security and protecting customer privacy. This identity check security system provides a high cost-effective security solution, beneficial for medium to large organizations, as well as individuals.

User registration consists of a onetime short biometric process.

Following registration, user identification requires only 2-3 seconds – the user sets his finger on the fingerprint scanner and after a brief and reliable matching process over the web, his identity result is used for application access or given to a third party via encrypted internet communication. The system is designed for complete privacy, allowing

a unique ID to be used instead of a real name. Timeneto system never keeps fingerprint images.

The biometric security system is compatible with most Operating Systems and with all web browsers. The system uses a central database where all registration records (encrypted; no fingerprint images are kept) are saved.

The system's parallel multi-node fingerprint server architecture makes this biometric security solution highly scalable and secured.

The Company

Since 2007, Timeneto is serving clients around the globe, in USA, China, Germany, Israel and more.

Timeneto's System processed millions of identification transactions during the past year, a number which is constantly growing.

Timeneto is looking to expand its technology implementation into new devices and new applications worldwide.

Timeneto's system can contribute to your organization and users.

Web-based biometric identification services system enables users to validate identification via smartphones, tablets, PCs and laptops, and create a secured access, protected from cyber security risks, to personal data and third party applications.
